medicity

Medicity is an emerging Australian-based digital health brand, committed to the improvement of patient outcomes, experience and engagement. Emanating from the Cabrini Centre for Innovation, Medicity collaborates with healthcare clients to co-design and develop tailored digital health solutions that are flexible, scalable and secure.

Our dedicated team aspires to become one of Australia's recognised leaders in digital health technologies. We pride ourselves on our passion for innovation and our partnerships with industry and academia.

Our process:

- Employ design thinking and human centred design tools and methodologies to deeply understand problems in health
- Establish and nurture rich client relationships
- Co-design solutions with clients and their users
- Rapidly prototype and iterate and present these prototypes to stakeholders throughout the journey
- Develop software using the latest technologies, with security and privacy at the forefront

eCaptis

eCaptis is a secure medical-grade platform designed to seamlessly capture and report patient reported outcome measures (PROMs) and experience measures (PREMs). When tailored and integrated with health programs, PROMs have been shown to drive improvement in clinical outcomes while meeting the expectations and needs of people accessing care in today's informed society. This is achieved through the delivery of health-based questionnaires relating to quality of life, symptoms, functional ability and other aspects of patients' health and well-being.

HealthKite

HealthKite is a virtual monitoring platform designed to connect patients with remote care teams. The platform enables the seamless collection and transmission of healthcare data from home to hospital and offers a number of tools designed to drive patient engagement, efficiencies and total cost reduction.

The Health Kite platform consists of two key components – the patient interface, accessed via a tablet, and the clinical portal, accessed by the care team through a web browser.

Eve

Eve is a revolutionary pregnancy app designed to provide new and expectant mothers with access to numerous tools and an extensive library of information to enrich their pregnancy, birthing and parenting experience.

Eve allows mothers and their partners can seamlessly keep track of appointments, participate in virtual pregnancy classes and send direct messages to their Midwives, all from their personal phone or tablet. Tools such as the baby movement tracker, emotional health tracker and physical health tracker all feed data back to the Midwives in the hospital who can access this information in real time via the Eve portal whilst monitoring and communicating with the mother.

Apps

Our team is proficient at developing easy-to-use medical grade software and because of this, we've been entrusted by several clients to build a number of bespoke applications including:

TeleO2 – a live digital engagement platform designed to provide domiciliary oxygen therapy patients with various tools and resources in order to provide a more informed, comfortable and connected patient experience

STAR-MH – a digital screening tool for identifying mental disorders in asylum seekers and new refugees

HAItime – an innovative app used by clinicians to help reduce the risk of hospital-acquired infections (HAIs)

AV Assets – an app built for Ambulance Victoria, used for auditing and managing medical asset inventory allocated to vehicles and branches
